SpermFunc® ARIC - Kit for Determination of Induced Acrosome Reaction by Calcium Ionophore A23187

The test result can provide the evidence for analysis of infertile pathogeny and selection of the treatment in ART.

SpermFunc® ARIC test results:

- A. Sperm without acrosome reaction
B. Sperm with acrosome reaction

Features:

- Designed according to the method recommended by WHO
- The revolutionary design and the first product for determination of induced acrosome reaction by calcium ionophore A23187 in the world.
- Provide more guarantees in accuracy and repeatability of testing results.
- Using the sensitive and specific method of testing according to WHO criteria.
- All the testing technique is proved by a systemic study.
- All the components of this kit are under control of the strict quality.
- The configuration of the zone in sperm acrosome after induction is typical and distinct easy to be observed.
- The background of fluorescence is clear and the intensity of fluorescence is high and stable for at least 15 days.
- The operation of the SpermFunc® ARIC is more humanized.
- Without long reaction time and high-intensity testing work in the previous method. Easy to use.
- 40T/Kit
- CE approved
